Build a Keyboard to ESC the Matrix - Deliverable

October 21, 2025

In the “Build a Keyboard to ESC the Matrix” workshop with Ashley He, we were informed of the safety instructions at the Mill and other UW maker spaces, introduced to the equipment in soldering, the simple 5 steps of soldering and provided a demonstration. Our task for the deliverable was to solder together a 3x3 matrix for a 3D printed keyboard that can then be programmed. Personally, I learned how to solder and combine it with a bit of circuitry. It was an interesting workshop since although I have welded before, I felt that soldering was much easier as a first-timer and was satisfying to see the solder cool as each piece came together. As a mechanical engineering student, I am not sure if soldering will come into any of my classes, maybe in an electrical-lab course (besides EE 215). But maybe developing enough skills to solder, design and build my own full keyboard like Ashley was talking about would be a cool project in the future.
