ENGR 106 - HD 3D Models with Resin Printing Deliverable

December 4, 2025

Deliverable: Yoshi Figurine with Stand, Hole at Bottom Left Foot

A Slice of the Yoshi Deliverable

In this workshop, I learned how to 3D print with resin, including safety, setup, creating a file, printing, curing and then cleanup. For the deliverable, I chose a Yoshi figurine with a stand, imported the STL file in the chitubox, angled, shelled, added a hole at the bottom of the stand, aligned with the left foot of the figure, added supports, sliced then exported. Next, I attempted to print the yoshi file using the resin printers. Although the print itself failed multiple times, I learned how to create the file and setup and clean the resin printers. It was an interesting experience as an additive manufacturing technique, creating the figure upside down as the plate dunks into the vat, very different from filament printing. While creating yoshi this time around failed, in the future I would like to try to print something again until I am successful! A skill to develop next is using CAD to design my own STL file and then print that instead of using ones that other people have posted online.
